PSTAT 126

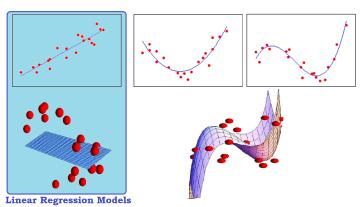

Regression Analysis

Laura Baracaldo

Lecture 1
Introduction to Linear Models

Introduction

Regression Analysis: Statistical method that allows the exploration of the relationship between two or more variables.

Laura Baracaldo PSTAT 126 2 / 18

Introduction

- ullet Y: Response, outcome, output, dependent variable. (Continuous)
- $(X_1,...X_p)^T$: vector of predictors, inputs, independent or explanatory variables. (Can be of any kind: qualitative or quantitative)

Goals:

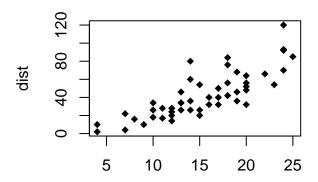

- Prediction of future or unmeasured responses given values of the predictors.
- Assessment of the effect/relationship between explanatory variables and response. Existence of causality?

Laura Baracaldo PSTAT 126 3/18

Cars example

 $X: \mathsf{Speed} \qquad Y: \mathsf{Distance}$

```
par(mar=c(3,4,0.5,1))
plot(cars, pch=18)
```

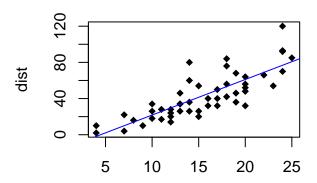

Laura Baracaldo PSTAT 126 4 / 18

Cars example

```
X: \mathsf{Speed} Y: \mathsf{Distance}
```

```
par(mar=c(3,4,0.5,1))
plot(cars, pch=18)
abline(lm( dist ~ speed, data=cars), col="blue")
```

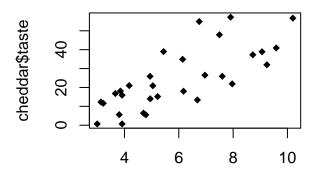

Laura Baracaldo PSTAT 126 5/18

Cheddar example

 $X: \mathsf{Hydrogen}$ sulfide concentration $Y: \mathsf{Taste}$ score

```
library(faraway)
par(mar=c(3,4,0.5,1))
plot(cheddar$H2S, cheddar$taste, pch=18)
```

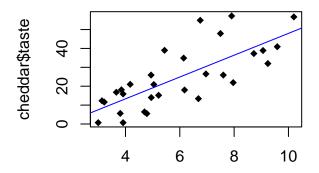

Laura Baracaldo PSTAT 126 6 / 18

Cheddar example

 $X: \mathsf{Hydrogen}$ sulfide concentration $Y: \mathsf{Taste}$ score

```
library(faraway)
par(mar=c(3,4,0.5,1))
plot(cheddar$H2S, cheddar$taste, pch=18)
abline(lm( taste ~ H2S, data=cheddar), col="blue")
```

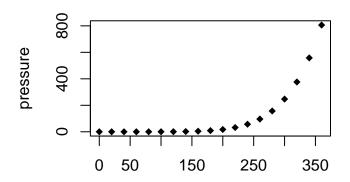

Laura Baracaldo PSTAT 126 7 / 18

Pressure example

 $X: {\sf Temperature} \qquad Y: {\sf Pressure}$

```
par(mar=c(3,4,0.5,1))
plot(pressure, pch=18)
```

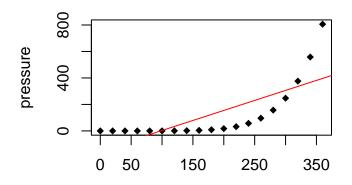

Laura Baracaldo PSTAT 126 8 / 18

Pressure example

```
X: {\sf Temperature} \qquad Y: {\sf Pressure}
```

```
par(mar=c(3,4,0.5,1))
plot(pressure, pch=18)
abline(lm( pressure ~ temperature, data=pressure), col="red")
```

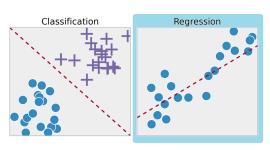

Not Linear!

Laura Baracaldo PSTAT 126 9 / 18

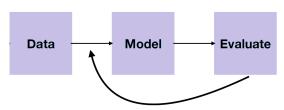

Regression vs Classification

- Regression: Y is continuous. Numerical values (e.g. price, blood pressure, confirmed COVID-19 cases).
- Classification Y discrete labels. Categorical values.
 (e.g. survived/died, digit 0-9, if Bitcoin price is going up tomorrow).

Laura Baracaldo PSTAT 126 10 / 18

General Workflow

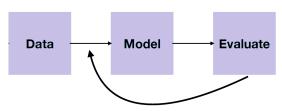

1. Data: We collect data for all n subjects in the study, and identify Y and X:

$$Y = \begin{bmatrix} y_1 \\ \end{bmatrix} \qquad \qquad X = \begin{bmatrix} x_{11} & x_{12} & \dots & x_{1p} \\ & & & & \end{bmatrix}$$

Laura Baracaldo PSTAT 126 11 / 18

General Workflow

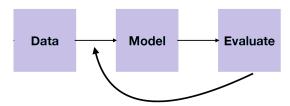

1. Data: We collect data for all n subjects in the study, and identify Y and X:

$$Y = \begin{bmatrix} y_1 \\ y_2 \end{bmatrix} \qquad \qquad X = \begin{bmatrix} x_{11} & x_{12} & \dots & x_{1p} \\ x_{21} & x_{22} & \dots & x_{2p} \end{bmatrix}$$

Laura Baracaldo PSTAT 126 12 / 18

General Workflow

1. Data: We collect data for all n subjects in the study, and identify Y and X:

$$Y = \begin{bmatrix} y_1 \\ y_2 \\ \vdots \\ y_n \end{bmatrix} \qquad X = \begin{bmatrix} x_{11} & x_{12} & \dots & x_{1p} \\ x_{21} & x_{22} & \dots & x_{2p} \\ \vdots & \vdots & \dots & \vdots \\ x_{n1} & x_{n2} & \dots & x_{np} \end{bmatrix}$$

• $Y \in \mathbb{R}^n$. $X \in \mathbb{R}^{n \times p}$

Laura Baracaldo PSTAT 126 13 / 18

Regression Model

$$Y = f(X_1, X_2, ... X_p) + \epsilon$$

- ϵ : Error/noise
- ullet f is unknown and must be learned from observations $(Y,X_1,...,X_p)$
- ullet Questions about f. Continuous? Smooth?
- f must be restricted. For the most part of this course: We assume f
 is linear.

Laura Baracaldo PSTAT 126 14 / 18

Linear Regression Model

We assume the response is written as linear representation of predictors:

$$Y = \beta_0 + \beta_1 X_1 + \dots + \beta_p X_p + \epsilon$$

• **Estimation:** The goal is to estimate unknown parameters $\beta_0, \beta_1, ... \beta_p$.

Laura Baracaldo PSTAT 126 15 / 18

Linear Regression Model

Linear:

$$Y = \beta_0 + \beta_1 \log(X_1) + ... + \beta_p X_p^2 + \epsilon = \beta_0 + \beta_1 W_1 + ... + \beta_p W_p + \epsilon$$

NOT Linear:

$$Y = \beta_0 + X_1^{\beta_1} + \dots + \beta_p X_p + \epsilon$$

Laura Baracaldo **PSTAT 126** 16 / 18

Matrix Representation

$$\begin{bmatrix} y_1 \\ y_2 \\ \vdots \\ y_n \end{bmatrix} = \begin{bmatrix} 1 & x_{11} & \dots & x_{1p} \\ 1 & x_{21} & \dots & x_{2p} \\ \vdots & \vdots & \dots & \vdots \\ 1 & x_{n1} & \dots & x_{np} \end{bmatrix} \begin{bmatrix} \beta_0 \\ \beta_1 \\ \vdots \\ \beta_p \end{bmatrix} + \begin{bmatrix} \epsilon_1 \\ \epsilon_2 \\ \vdots \\ \epsilon_n \end{bmatrix}$$

$$Y = X\beta + \epsilon$$

Model Assessment

- Prediction: We seek to accurately predict future response given predictors.
- ② Inference: We want to assess the quality of our predictions and (or) estimation.
- Oiagnostics: what if the linear model assumptions go wrong? how can we tell?
- Model selection: We try to find the "best" linear model tha links the response and the set of predictors.
